

COLLEGE OF SCIENCE

PHYS2020
Simulation Plan
Semester One 2026

Family name: Lukacs

Given names: Matthew David Carmel

Student number: u8507410

0.1 What I've done so far

I have now set up a github repository which is also linked to my google drive

<https://github.com/carmel3141/Brownian-Motion-Simulation-PHYS2020>

I have tested a few commits to see if i remember how to use github. I know what formulas I will be testing from the Brownian Motion Lab manual, and i will be using numpy and matplotlib in python to implement it. The rng generator in python should suffice, and it should be quite quick to set something very basic up, then I will scale it up from there. I know I will need to compare these results to real results, and I might be able to reference my brownian motion laboratory results even, perhaps.

yeah so i accidentally bricked my git at one point but its fixed now
